

Nicaragua

Nicaragua has reduced the malaria incidence by over 96% in the past decade compared to the year 2000, surpassing its MDG 6 goal for the year 2015. Yet it reported an increase in malaria incidence in 2011 from the previous year. No deaths due to malaria have been reported since 2007.

Malaria is largely localised to the north-eastern areas of the country, especially along the border areas with Honduras. The district of Waspan, bordering Honduras, alone reported 50% of all cases and 71% of *Plasmodium falciparum* and mixed infections of Nicaragua in 2011. *Anopheles albimanus* and *An. pseudopunctipennis* are the principal vectors.

The country uses chloroquine and primaquine as its first line of treatment for both *P. falciparum* and *P. vivax* infections, following a regimen of 7 days for *P. vivax*. A study conducted in 2006 demonstrated that *P. falciparum* remains sensitive to chloroquine in the country.

Malaria cases in children below the age of 15 years has decreased from 40% in 2008 to 25% in 2011, and those in 15-49 years stood at 65% in 2011. Protection by indoor residual spraying and long lasting insecticide treated bednets has been maintained almost constant over the past few years even as malaria has been decreasing.

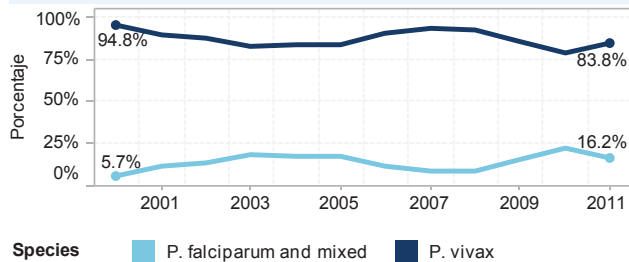

Malaria control in the country is supported by a Global Fund grant and the AMI-RAVREDA project. An integrated vector control program in the Ministry of Health is responsible for malaria control and other vector-borne diseases, leading to problems in delineating financing exclusively for malaria control.

Mortality and morbidity due to malaria, 2000 - 2011

Percentage of malaria cases by species type, 2000 - 2011

Malaria cases by sex and age, 2011

Slides examined and SPR, 2000 - 2011

Confirmed malaria cases and patients treated, 2000 - 2011

People protected by IRS and LLINs distributed, 2000 - 2011

Funding for malaria control, 2000 - 2011
